

AI Judgment Wrapper

A concise internal review brief for existing AI products that may trigger material external actions.

Problem

AI output can move toward money, access, records, approval, or external release before evidence and authority are sufficiently reviewed.

Position

AI proposes

LimFlex returns a decision artifact

Host executes, withholds, or routes

Decision boundary

Use configured states such as proceed or adopt, limit, hold, review or Human Gate, and block or reject. Missing evidence remains explicit and can return to the same case for re-evaluation.

What remains unchanged

The model, agent, workflow, policy owner, and host execution authority remain in place.

First evaluation

Choose one workflow, representative historical or test cases, the current review point, available evidence, and the host authority owner.

Buyer questions

- Where can AI output become a material action?
- What evidence is required before action?
- Who owns policy and execution authority?
- What happens when evidence is missing?
